Feedback - March 2021

# Non-Forceps Extraction Techniques

Traditional extraction techniques aim to remove the tooth from its dentoalveolar housing. In certain instances, achieving this objective involves fracturing or surgical removal of surrounding bone. “Atraumatic” dental extraction techniques preserve the bone and the gingival architecture, decrease the incidence of root fractures, maintain the buccal bone plate, and allow for the option of future or immediate dental implant placement. This interactive lecture by a UK expert focused on the basic principles of using elevators and luxators and their safe use in appropriate clinical situations to facilitate effective removal with bone preservation and damage limitation.
